Specification Amendments:

Amend paragraph number [031] of the substitute specification filed on June 27, 2005 as follows:

[031] In order to let the billing, in a connection which uses ABR, also be dependent on the capacity desired by the user, that value r1 is read by device 2 from passing RM (Resource Management) cells and passed on, through the calculation device 4, to the billing system 5. In the same way a value r2 is extracted, via a return connection 1', in which measuring device 2', a clock generator 3' and a calculation device 4' are included, from the "backward" RM cells, which is an indication for the maximum cell rate which is (dynamically) assigned by the network to the user. That value too, is passed on to the billing system and is included, as well as is the value r1, in the price to be charged to the user.
